# A Logic Puzzle

## 1 Warm up

Alice, Alice's husband, their son, their daughter, and Alice's brother were involved in a murder. One of the five killed one of the other four. The following facts refer to the five people mentioned:

- A man and a woman were together in a bar at the time of the murder.
- The victim and the killer were together on a beach at the time of the murder.
- One of Alice's two children was alone at the time of the murder.
- Alice and her husband were not together at the time of the murder.
- The victim's twin was not the killer.
- The killer was younger than the victim.

Which one of the five was the victim? Write down your [argument \(论证\)](#).

## What constitutes an argument?

1 Warm up

translate nature language into formal language  
→ 逻辑推理 判斷

- **Statements:** e.g., Alice was in a bar at the time of murder.
- **Logical indicators:** e.g., ...and..., ...or..., if...then..., ...because..., etc.
- **Common sense:** e.g., a father cannot be younger than his child; a parent and his or her child cannot be twins.
- **Inference rules:** e.g., if Alice was with her brother at the bar, then ..... we have a contradiction. Therefore, Alice was not with her brother in the bar.

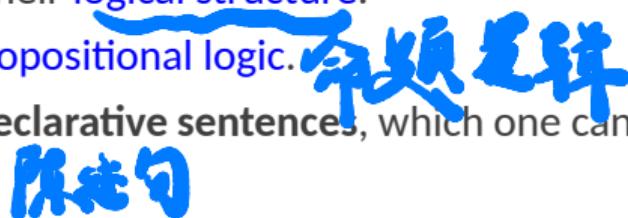

How to (mechanically) judge an argument is rigorous?

# How to (mechanically) judge an argument is rigorous?

## 1 Warm up

- To make arguments rigorous, we need to develop a language in which we can express sentences in such a way that brings out their logical structure.
- The language we begin with is the language of propositional logic.
- Propositional logic is based on propositions, or declarative sentences, which one can argue as being true or false.

# Table of Contents

## 2 Propositions & Connectives

- ▶ Warm up
- ▶ Propositions & Connectives
- ▶ From Symbols to Language
- ▶ Propositional Logic as a Formal Language

# Definition

## 2 Propositions & Connectives

- **Proposition (命题)**: A proposition is a declarative sentence that can be judged as either true or false.
- **Atomic Proposition (原子命题)**: A proposition that does not contain any smaller part that is still a proposition is called an atomic proposition. 
- **Compound Proposition (复合命题)**: A proposition that involves the assembly of multiple propositions is called a compound proposition.

# Which are Propositions?

## 2 Propositions & Connectives

- 雪是白的。  $P$   $T$
  - 雪是黑的。  $P$   $F$
  - 好大的雪啊!  $X$
  - $2 + 2 = 5$   $P$   $F$
  - Where are you going?  $X$
  - Ready? Go!  $X$
  - $x + y < 0$   $X$
  - This sentence is false.  $X$
- 不能判 T/F 就不是 proposition  
(加上  $x < 0, y < 0$  才是)
- paradox

# Logical Connectives

## 2 Propositions & Connectives

# 逻辑与命题

Words that connect multiple propositions to form a compound proposition are called logical connectives. For example:

- ... and ... (并且)
- not ... (并非)
- ... or ... (或者)
- if ... then ... (如果... 那么...)
- ... if and only if ... (当且仅当)

# Examples of Compound Propositions

2 Propositions & Connectives

小判断名词

2 is an odd num .(P)  
或文  
加3 connective

- 2 is not an odd number.
- 2 is both an even number and a prime number.
- If a quadrilateral (四边形) has a pair of opposite sides that are parallel and equal, then it is a parallelogram (平行四边形).

OP  
Bq

Or  
3 atomic propositions

# Symbols

## 2 Propositions & Connectives

- To bring out the logical form of declarative sentences in natural language, we translate them into strings of symbols.
- This gives us a compressed but still complete encoding of declarative sentences and allows us to concentrate on the mere mechanics of our argumentation.

# Symbols

## 2 Propositions & Connectives

→ 小写

- Atomic proposition:

$p, q, r, \dots$

→ 大写

- Compound proposition:

$A, B, C, \dots$

$\phi, \psi, \alpha, \beta \dots$

又是 convention

$p \wedge q$

Connectives	Read as	名称	Term
$\wedge$	and	合取	conjunction
$\vee$	or	析取	disjunction
$\neg$	not	否定	negation
$\rightarrow$	if...then...	蕴含	implication
$\leftrightarrow$	if and only if	等价	equivalence

# Symbolic Representation

## 2 Propositions & Connectives

$p$ : Today is Friday.	Today is <u>not</u> Friday.	$\neg p$
$p$ : 2 is a prime number, $q$ : 2 is an even number.	2 is both a prime <u>and</u> an even number.	$p \wedge q$
$p$ : Freshmen take Java classes, $q$ : Freshmen take Python classes.	Freshmen take either Java <u>or</u> Python classes.	$p \vee q$
$p$ : It will rain tomorrow, $q$ : I will stay home and read.	If it rains tomorrow, <u>then</u> I will stay home and read.	$p \rightarrow q$
$p$ : A triangle is an isosceles triangle, $q$ : A triangle has two equal angles.	A triangle is an isosceles triangle <u>if and only if</u> it has two equal angles.	$p \leftrightarrow q$
$p$ : 你是大一新生, $q$ : 你能在寝室用电脑。	只有你不是大一新生, <u>才能</u> 在寝室用电脑。	$\neg p \rightarrow q$

# Think

## 3 From Symbols to Language

How do we organize symbols (e.g.,  $p, q, r, \dots, \wedge, \vee, \dots$ ) to form a language?

# Languages in General

## 3 From Symbols to Language

- All languages have a set of symbols, rules for constructing compound constructions out of atomic constructions, and meanings assigned to the significant units.
  - For example, the letter "A" is part of English, but not part of Hindi.
- The **syntax** of a language is the grammar of the language.
  - For example, English is a Subject-Verb-Object language, while Arabic is Subject-Object-Verb.
- The semantics of a language is the meaning of the significant parts.
  - For example, "snow" means snow in English, but "schnee" means snow in German.

# Formal Language

## 3 From Symbols to Language

A formal language consists of words whose letters are taken from an alphabet and are well-formed according to a specific set of rules called a formal grammar.

- Alphabet: A set of symbols.
- String: A finite sequence of symbols from the alphabet.
- A formal language is a set of strings all over the same alphabet.

# Formal Language

## 3 From Symbols to Language

进阶  
符号  
语言

We use whichever alphabet is suitable to the task at hand when working with formal languages: the standard Roman alphabet for processing text, decimal digits for processing numbers, the alphabet A, T, C, G for processing genetic data, etc.

	<i>symbols</i>
<i>binary</i>	01 (or ab)
<i>Roman</i>	abcdefghijklmnoprstuvwxyz ABCDEFGHIJKLMNPQRSTUVWXYZ
<i>decimal</i>	0123456789
<i>special</i>	~`!@#\$%^&*()_-+={[]} \\:;\"'<,>.?/
<i>keyboard</i>	<i>Roman + decimal + special</i>
<i>genetic code</i>	ATCG
<i>protein code</i>	ACDEFGHIJKLMNOPQRSTUVWXYZ

# Propositional Logic

## 3 From Symbols to Language

- The language of propositional logic, PL, is a formal language used in logic to study and analyze propositions and their logical relationships.
- It consists of a set of symbols and logical connectives that represent simple statements (propositions) and allow the construction of compound propositions.
- It is possible to translate sentences of most natural languages, such as Greek, English, German, French, etc... into PL.

# Propositional Logic

## 3 From Symbols to Language

We will introduce the formal language of propositional logic  $\mathcal{L}^P$  in terms of:

- Symbols and Alphabet
- Syntax: The rules governing the arrangement of symbols to form valid strings.
- Semantics: Truth values
- Inference rules and deduction systems

# Table of Contents

## 4 Propositional Logic as a Formal Language

- ▶ Warm up
- ▶ Propositions & Connectives
- ▶ From Symbols to Language
- ▶ Propositional Logic as a Formal Language

# Alphabet of $\mathcal{L}^P$

## 4 Propositional Logic as a Formal Language

$\mathcal{L}^P$ , as the language of proposition logic, has 3 types of symbols.

- Atomic proposition (Atom):  $p, q, r, \dots$
- Logical connectives:  $\wedge, \vee, \neg, \rightarrow, \leftrightarrow$
- Punctuation: ( and )

# Expressions of $\mathcal{L}^P$

## 4 Propositional Logic as a Formal Language

- Expressions (表达式): finite strings of symbols, e.g.,  $p$ ,  $pqqr$ ,  $(\neg r)$ ,  $p \wedge q \rightarrow r$ .
- The length of an expression is the number of occurrences of symbols in it.
- Empty expression: an expression of length 0, denoted by  $\lambda$ .
- Two expressions  $u$  and  $v$  are equal if they are of the same length and have the same symbols in the same order.
- An expression is read from left to right.

# Formulas of $\mathcal{L}^P$

## 4 Propositional Logic as a Formal Language

inductive definition

The well-formed formulas of propositional logic are expressions which we obtain by using the construction rules below, and only those, finitely many times:

- Atom: Every propositional atom  $p, q, r, \dots$  is a well-formed formula.
- $\neg$ : If  $\phi$  is a well-formed formula, then so is  $(\neg\phi)$ .
- $\wedge$ : If  $\phi$  and  $\psi$  are well-formed formulas, then so is  $(\phi \wedge \psi)$ .
- $\vee$ : If  $\phi$  and  $\psi$  are well-formed formulas, then so is  $(\phi \vee \psi)$ .
- $\rightarrow$ : If  $\phi$  and  $\psi$  are well-formed formulas, then so is  $(\phi \rightarrow \psi)$ .
- $\leftrightarrow$ : If  $\phi$  and  $\psi$  are well-formed formulas, then so is  $(\phi \leftrightarrow \psi)$ .

$$\begin{array}{c} (\phi * \psi) \\ \downarrow \\ \wedge \vee \rightarrow \leftrightarrow \\ \text{Atom} \end{array}$$

# Formulas of $\mathcal{L}^P$

## 4 Propositional Logic as a Formal Language

### Definition 3.1 Atom( $\mathcal{L}^P$ )

Atom( $\mathcal{L}^P$ ) is the set of expressions of  $\mathcal{L}^P$  consisting of a proposition symbol only.

### Definition 3.2 Form( $\mathcal{L}^P$ )

An expression  $A \in \text{Form}(\mathcal{L}^P)$  if and only if its being so follows from (i)~(iii):

- (i)  $\text{Atom}(\mathcal{L}^P) \subseteq \text{Form}(\mathcal{L}^P)$
- (ii) If  $A \in \text{Form}(\mathcal{L}^P)$ , then  $(\neg A) \in \text{Form}(\mathcal{L}^P)$ .
- (iii) If  $A, B \in \text{Form}(\mathcal{L}^P)$ , then  $(A \wedge B), (A \vee B), (A \rightarrow B), (A \leftrightarrow B) \in \text{Form}(\mathcal{L}^P)$ .

# Formulas of $\mathcal{L}^P$

## 4 Propositional Logic as a Formal Language

Inductive definitions, like the one of well-formed propositional logic formulas above, are so frequent that they are often given by a defining grammar in Backus Naur form (BNF).

In that form, the above definition reads more compactly as:

$$\phi ::= p | (\neg\phi) | (\phi \wedge \phi) | (\phi \vee \phi) | (\phi \rightarrow \phi) | (\phi \leftrightarrow \phi)$$

# Formulas of $\mathcal{L}^P$

## 4 Propositional Logic as a Formal Language

Is this a well-formed formula?

$$(((\neg p) \leftrightarrow (q \vee r)) \rightarrow (r \wedge p))$$

# Parse Tree

## 4 Propositional Logic as a Formal Language

解析树

### Definition 3.3

A parse tree of a formula in  $\mathcal{L}^P$  is a tree such that

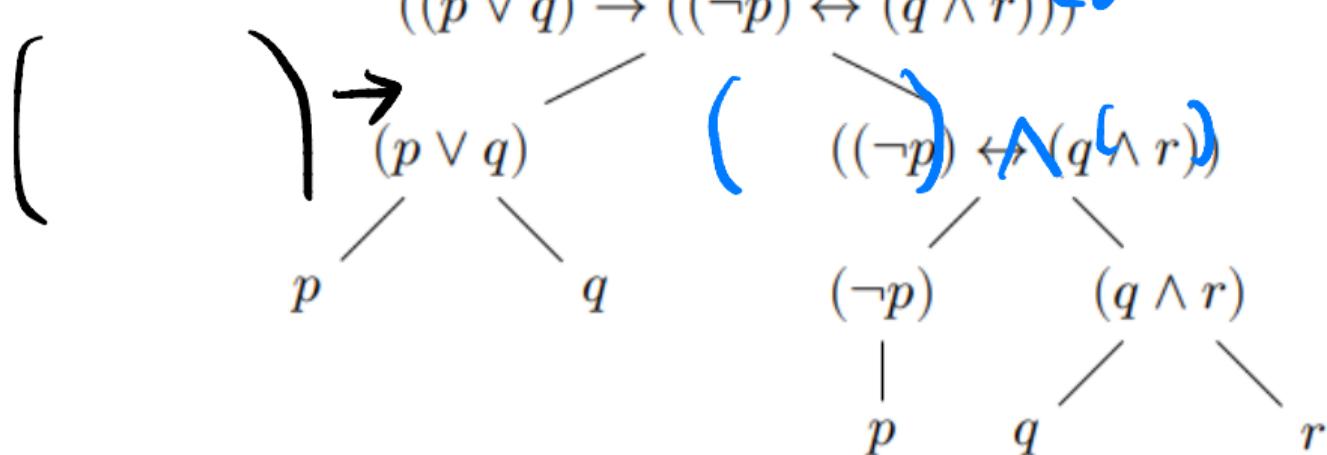

- The root is the formula. 根
- Leaves are atomic formulas, and
- Each internal node is formed by applying some formation rule on its children.

## Parse Tree

### 4 Propositional Logic as a Formal Language

A parse tree of  $((p \vee q) \rightarrow ((\neg p) \leftrightarrow (q \wedge r)))$

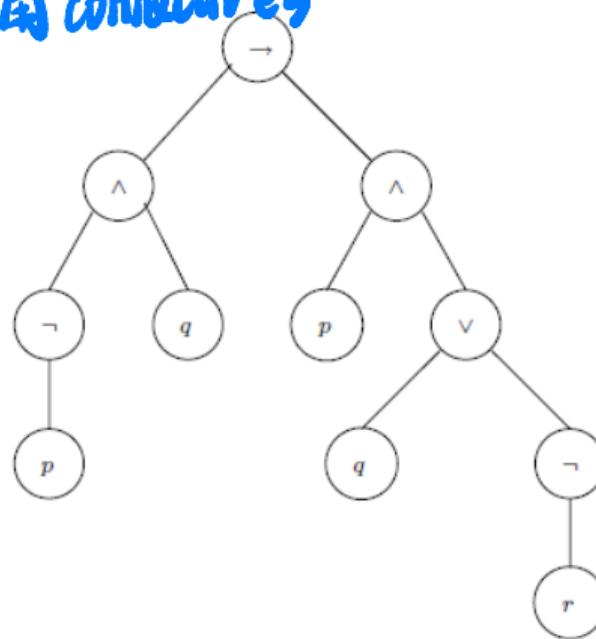

# Parse Tree

## 4 Propositional Logic as a Formal Language

A simplified parse tree of  $((\neg p) \wedge q) \rightarrow (p \wedge (q \vee (\neg r)))$

node 12 connects

# Parse Tree

## 4 Propositional Logic as a Formal Language

公式表达式  $\Leftrightarrow$  有 parse tree

### Theorem 3.1

An expression of  $\mathcal{L}^P$  is a well-formed formula if and only if there is a parse tree of it.

### Theorem 3.2

Each well-formed formula of  $\mathcal{L}^P$  has a unique parsing tree.

# Subformula

## 4 Propositional Logic as a Formal Language

出现在  $F$  的 parse tree  
中 (包括 root)

### Definition 3.4

A formula  $G$  is a subformula of formula  $F$  if  $G$  occurs within  $F$ .  $G$  is a proper subformula of  $F$  if  $G \neq F$ . (非 root)

The nodes of the parse tree of  $F$  form the set of subformulas of  $F$ .

### Definition 3.5

直接公式

主联结词

Immediate subformulas are the children of a formula in its parse tree, and leading connective is the connective that is used to join the children.

Q: The subformulas and leading connective for  $((\neg p) \leftrightarrow (q \wedge r))$ ?

Semantics		

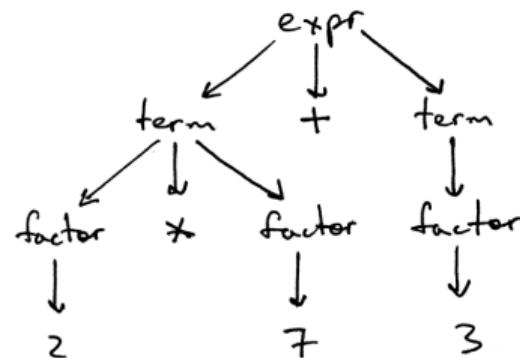

# Applications

## 4 Propositional Logic and Formal Language

A parse tree is created by a parser, which is a component of a **compiler** that processes the source code and checks it for syntactic correctness.

2 \* 7 + 3

Parse tree

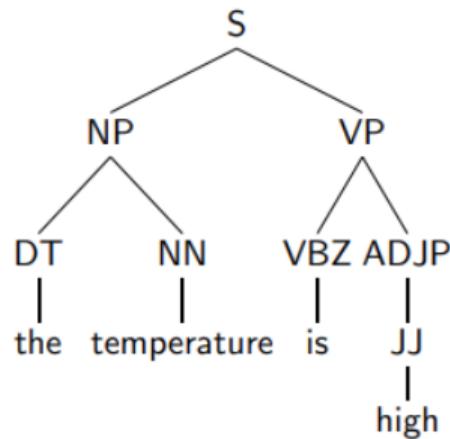

# Applications

## 4 Propositional Logic as a Formal Language

自然语言处理

In NLP, a parse tree can be used to computationally reason about a natural-language sentence.

# The Structure of Formula

## 4 Propositional Logic as a Formal Language

Let's consider important properties regarding the structure of formulas.

### Lemma 3.1

Well-formed formulas of  $\mathcal{L}^P$  are non-empty expressions.

非空

### Lemma 3.2

Every well-formed formula of  $\mathcal{L}^P$  has an equal number of opening and closing brackets.

Base : P

Induction Hypothesis :  $P(A)$ ,  $P(BC)$

Inductive :  $(\neg A)$

Step  $(A \wedge B)$

(与) 数量相同

# The Structure of Formula

## 4 Propositional Logic as a Formal Language

祝內多勝

順序是接

- $uv$  denotes the result of concatenating two expressions  $u, v$  in this order. Note that  $\lambda u = u\lambda = u$ .
- $v$  is a segment of  $u$  if  $u = w_1vw_2$  where  $u, v, w_1, w_2$  are expressions.
- $v$  is a proper segment of  $u$  if  $v$  is non-empty and  $v \neq u$ .
- If  $u = vw$ , where  $u, v, w$  are expressions, then  $v$  is an initial segment (prefix) of  $u$ ,  $w$  is a terminal segment (suffix) of  $u$ .
- If  $u = vw$ , where  $u, v, w$  are expressions, and  $v, w$  are non-empty, then  $v$  is an proper prefix of  $u$ ,  $w$  is a proper suffix of  $u$ .

# The Structure of Formula

## 4 Propositional Logic as a Formal Language

### Lemma 3.3

- Every proper prefix of a well-formed formula in  $\mathcal{L}^P$  has more opening brackets than closing brackets.
- Similarly, every proper suffix of a well-formed formula in  $\mathcal{L}^P$  has more closing brackets than opening brackets.
- Hence, proper prefix and proper suffix are not formulas in  $\mathcal{L}^P$  (Lemma 3.2).

不是 well-formed formula

# The Structure of Formula

## 4 Propositional Logic as a Formal Language

Every proper prefix of a well-formed formula in  $\mathcal{L}^P$  has more opening brackets than closing brackets.

Proof by (structural) induction:

Let  $P(\varphi)$  be the property that every proper prefix of the well-formed formula  $\varphi$  has more opening brackets than closing brackets. We prove  $P(\varphi)$  is true for all well-formed formulas  $\varphi$  by structural induction.

Assumption doesn't hold 元素之和

**Base Case:** If  $\varphi$  is an atom, then there are no proper prefixes and the claim is vacuously true.

**Inductive Hypothesis:** Assume that  $P(\alpha)$  and  $P(\beta)$  are true for some well-formed formulas  $\alpha$  and  $\beta$ .

Complete the induction step by yourself.

# The Structure of Formula

## 4 Propositional Logic as a Formal Language

### Unique Readability Theorem

There is a unique way to construct every well-formed formula.

#### Proof by induction

Let  $P(\varphi)$  be the property that there is a unique way to construct the well-formed formula  $\varphi$ . We prove this property for all well-formed formulas  $\varphi$  by structural induction.

**Base case:** There is only one way to construct an atom.

**Inductive Hypothesis:** Assume that  $P(\alpha)$  and  $P(\beta)$  are true for some well-formed formulas  $\alpha$  and  $\beta$ .

# The Structure of Formula

## 4 Propositional Logic as a Formal Language

### Unique Readability Theorem

There is a unique way to construct every well-formed formula.

Proof by induction (continued)

Inductive Step: Consider two possibilities:

- $\varphi = (\neg\alpha)$
- $\varphi = (\alpha * \beta)$

*assume another formula can be used to represent  $\varphi$*

*$\varphi = (\alpha' * \beta') \rightarrow \text{so } \alpha = \alpha'$  lead to contradiction*

(Proved in class)

$$\varphi = (\alpha' * \beta') \stackrel{\exists C}{\rightarrow} (\alpha * \beta) = \alpha$$

# Conventions

## 4 Propositional Logic as a Formal Language

逻辑上(1)很重要

可读

For readability, we employ the following convention, which states that we may drop the outermost parentheses.

If  $F$  or  $(F)$  is a formula, then we view  $F$  and  $(F)$  as the same formula.

But, how do we interpret formulas like:  $p \wedge q \rightarrow \neg r \vee q$ ?

# Precedence

## 4 Propositional Logic as a Formal Language

Parentheses are used to resolve ambiguity. But they are hard to read.

If no parentheses are present, we could use (precedence and associativity) to disambiguate formulas.

- Each connective on the left has priority over those on the right.  $\neg, \wedge, \vee, \rightarrow, \leftrightarrow$ .
- Parentheses take the highest precedence.
- Connectives are assumed to associate to the right (right associative), i.e., first group the rightmost occurrence. For example,  $p \rightarrow q \rightarrow r$  means  $p \rightarrow (q \rightarrow r)$

# Examples

## 4 Propositional Logic as a Formal Language

Add back the brackets based on the precedence rules.

- $\neg p \rightarrow q$
- $p \wedge q \rightarrow r$
- $p \wedge q \rightarrow \neg r \vee q$
- $\neg p \rightarrow p \wedge \neg q \vee r \leftrightarrow q$
